

KP1HT Compactor IC-PAC

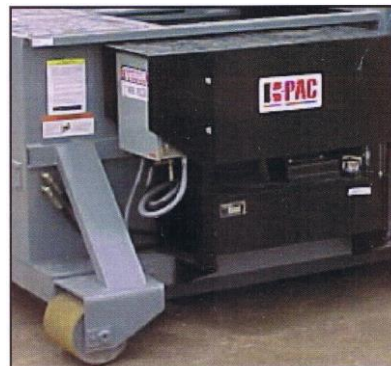

Hy-Tail Self-Contained Compactor with 1 cubic yard loading chamber

K-PAC's KPIHT Self-Contained Compactor is an excellent choice where vehicle maneuvering space is limited, including chute or dock fed applications. By building the compactor onto the door where compacted solid waste material is emptied, time is saved by eliminating the extra maneuver required to turn conventional roll-off compactors. The hydraulic tailgate facilitates dumping of the compacted refuse at the landfill or collection site. One piece

construction between packer head and container, and a 44" liquid retention height assure leak proof performance.

The KPIHT's 1 cubic yard loading chamber, with a generous 32" x 46" clear top opening and 44" height, loads easily from chute, dock or ground level. A higher ram face pressure and deeper (13") ram penetration give the KPIHT the best compaction performance in it's class.

Optional mounted power pack provides flexibility in placement and application of the KPIHT Compactor. Separate power pack is standard equipment. Key operated control panel offers security and controlled usage.
